# Characterization of Dirichlet distribution in terms of conditional distributions 

R Vasudeva<br>Department of Studies in Statistics, University of Mysore, Manasagangotri, Mysuru 570006, India. Emeritus fellow, University grants Commission, India.

#### Abstract

In this paper, a necessary and sufficient condition is given in terms of conditional distributions, for an $n$-component random vector to be Dirichlet.

## 1. Introduction

Dirichlet distribution has applications in many areas of science like Biology, Geology, Management Science etc. It is also considered as a prior distribution in Baysian analysis. As a result, the study of this distribution, through various characterizations has attracted the statisticians over decades. Darroch and Ratcliff (1971) and Fabius (1973) have characterized it based on the independence of some functions of the underlying random vector. James and Mosimann (1980) introduced the concept of neutrality, using which they characterized Dirichlet distribution. Rao and Sinha (1988) have characterized the distribution, assuming the linearity of regressions. In this paper, we will be characterizing a multivariate Dirichlet distribution, specifying some conditional distributions. This technique of characterization has become popular over the years, see for example, Arnold et al. (1992), Sreehari (2005), Sreehari and Vasudeva (2012).
. A random vector $X^{\prime}=\left(X_{1}, X_{2}, \ldots, X_{n}\right)$ is said to have Dirichlet distribution if its probability density function (pdf) is given by

$$
\begin{equation*}
f\left(x_{1}, x_{2}, \ldots, x_{n}\right)=\frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n+1}\right)}{\prod_{i=1}^{n+1} \Gamma\left(p_{i}\right)} \prod_{i=1}^{n} x_{i}^{p_{i}-1}\left(1-x_{1}-x_{2}-\cdots-x_{n}\right)^{p_{n+1}-1} \tag{1}
\end{equation*}
$$

$x_{i} \geq 0, i=1,2, \ldots, n, x_{1}+x_{2}+\cdots+x_{n}<1$, where $p_{i}, i=1,2, \ldots, n+1$ are positive constants (for details, see Kotz et al. (2000)). The above distribution is denoted by Dirichlet $\left(p_{1}, p_{2}, \ldots, p_{n+1}\right)$.
. It is well known that the marginals are Dirichlet. In particular, the univariate marginals are Beta. The conditional distributions are not Dirichlet. However, if $Y_{i}=\frac{X_{i}}{1-X_{n}}, i=1,2, \ldots,(n-1)$, then $\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ given $X_{n}$ is Dirichlet. We give below, a brief proof of this result in the form of a lemma, as it plays a crucial role in our paper. We notice that the conditional distribution is invariant of the conditioning random variable (rv). The next section contains the lemma and the characterization theorem.

[^0]
## 2. Lemma and Theorem

Lemma 2.1. Let $X^{\prime}=\left(X_{1}, X_{2}, \ldots, X_{n}\right)$ be Dirichlet and let $Y_{i}=\frac{X_{i}}{1-X_{n}}, i=1,2, \ldots,(n-1)$. Then $\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ is Dirichlet and is independent of $X_{n}$.
Proof. The pdf of $X$ is given by

$$
f\left(x_{1}, x_{2}, \ldots, x_{n}\right)=\frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n+1}\right)}{\prod_{i=1}^{n+1} \Gamma\left(p_{i}\right)} \prod_{i=1}^{n} x_{i}^{p_{i}-1}\left(1-x_{1}-x_{2}-\cdots-x_{n}\right)^{p_{n+1}-1}
$$

$x_{i} \geq 0, i=1,2, \ldots, n, x_{1}+x_{2}+\cdots+x_{n}<1$, where $p_{i}>0, i=1,2, \ldots, n+1$ are constants. One can show that $X_{n}$ is $\operatorname{Beta}\left(p_{n}, p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right)$. Consequently, the conditional pdf of $\left(X_{1}, X_{2}, \ldots, X_{n-1}\right)$ given $X_{n}$ is

$$
\begin{aligned}
g_{1}\left(x_{1}, x_{2}, \ldots, x_{n-1} \mid x_{n}\right)= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right)}{\Gamma\left(p_{1}\right) \Gamma\left(p_{2}\right) \ldots \Gamma\left(p_{n-1}\right) \Gamma\left(p_{n+1}\right)} \\
& \times \frac{\prod_{i=1}^{n-1} x_{i}^{p_{i}-1}\left(1-x_{1}-x_{2}-\cdots-x_{n}\right)^{p_{n+1}-1}}{\left(1-x_{n}\right)^{p_{1}+p_{2}+\cdots+p_{n+1}-1}} .
\end{aligned}
$$

By the transformation, $Y_{i}=\frac{X_{i}}{1-X_{n}}, i=1,2, \ldots,(n-1)$, one can obtain the pdf of $\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ given $X_{n}$ as

$$
\begin{align*}
h\left(y_{1}, y_{2}, \ldots, y_{n-1} \mid x_{n}\right)= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right)}{\Gamma\left(p_{1}\right) \Gamma\left(p_{2}\right) \cdots \Gamma\left(p_{n-1}\right) \Gamma\left(p_{n+1}\right)} \\
& \times \prod_{i=1}^{n-1} y_{i}^{p_{i}-1}\left(1-y_{1}-y_{2}-\cdots-y_{n-1}\right)^{p_{n+1}-1} \tag{2}
\end{align*}
$$

$y_{i}>0, i=1,2, \ldots, n-1$ with $y_{1}+y_{2}+\cdots+y_{n-1}<1$.
Since the conditional distribution of $\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ is independent of the conditioning variable $X_{n}$, we note that $\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ and $X_{n}$ are independent. Further, by (2) we note that $\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ is Dirichlet $\left(p_{1}, p_{2}, \ldots, p_{n-1}, p_{n+1}\right)$.
Theorem 2.2. Let $X^{\prime}=\left(X_{1}, X_{2}, \ldots, X_{n}\right)$ be a random vector with continuous non-negative components and satisfying $X_{1}+X_{2}+\cdots+X_{n}<1$. Let $Y_{i}=\frac{X_{i}}{1-X_{n}}, i=1,2, \ldots,(n-1)$ and $Z_{i}=\frac{X_{i}}{1-X_{n-1}}, i=1,2, \ldots,(n-2), n$. Then $X$ is $\operatorname{Dirichlet}\left(p_{1}, p_{2}, \ldots, p_{n}, p_{n+1}\right)$ if and only if
(i) $Y^{\prime}=\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ is Dirichlet $\left(p_{1}, p_{2}, \ldots, p_{n-1}, p_{n+1}\right)$ and is independent of $X_{n}$ and
(ii) $Z^{\prime}=\left(Z_{1}, Z_{2}, \ldots, Z_{n-2}, Z_{n}\right)$ is $\operatorname{Dirichlet}\left(p_{1}, p_{2}, \ldots, p_{n-2}, p_{n}, p_{n+1}\right)$ and is independent of $X_{n-1}$.

Proof. Suppose that $X$ is $\operatorname{Dirichlet}\left(p_{1}, p_{2}, \ldots, p_{n}, p_{n+1}\right)$. By the above lemma, Conditions (i) and (ii) follow. We now establish the converse.
. Suppose that the conditions (i) and (ii) hold. Let $h_{1}(\cdot)$ and $h_{2}(\cdot)$ denote respectively the pdf's of $Y$ and $Z$. Then we have

$$
\begin{align*}
h_{1}\left(y_{1}, y_{2}, \ldots, y_{n-1}\right)= & h_{1}\left(y_{1}, y_{2}, \ldots, y_{n-1} \mid x_{n}\right) \\
= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right)}{\Gamma\left(p_{1}\right) \Gamma\left(p_{2}\right) \ldots \Gamma\left(p_{n-1}\right) \Gamma\left(p_{n+1}\right)} \\
& \times \prod_{i=1}^{n-1} y_{i}^{p_{i}-1}\left(1-y_{1}-y_{2}-\cdots-y_{n-1}\right)^{p_{n+1}-1} \tag{3}
\end{align*}
$$

$y_{i}>0, i=1,2, \ldots,(n-1), y_{1}+y_{2}+\cdots+y_{n-1}<1$.
Let $g_{1}(\cdot)$ denote the conditional pdf of $\left(X_{1}, X_{2}, \ldots, X_{n-1}\right)$ given $X_{n}$. From (3), one can get

$$
\begin{align*}
g_{1}\left(x_{1}, x_{2}, \ldots, x_{n-1} \mid x_{n}\right)= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right)}{\Gamma\left(p_{1}\right) \Gamma\left(p_{2}\right) \cdots \Gamma\left(p_{n-1}\right) \Gamma\left(p_{n+1}\right)} \\
& \times \frac{\prod_{i=1}^{n-1} x_{i}^{p_{i}-1}\left(1-x_{1}-x_{2}-\cdots-x_{n}\right)^{p_{n+1}-1}}{\left(1-x_{n}\right)^{p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}-1}} . \tag{4}
\end{align*}
$$

On similar lines, one can get the pdf $g_{2}(\cdot)$ of $\left(X_{1}, X_{2}, \ldots, X_{n-2}, X_{n}\right)$ given $X_{n-1}$ as

$$
\begin{align*}
g_{2}\left(x_{1}, x_{2}, \ldots, x_{n-2}, x_{n} \mid x_{n-1}\right)= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-2}+p_{n}+p_{n+1}\right)}{\Gamma\left(p_{1}\right) \Gamma\left(p_{2}\right) \ldots \Gamma\left(p_{n-2}\right) \Gamma\left(p_{n}\right) \Gamma\left(p_{n+1}\right)} \\
& \times \frac{\prod_{i=1, i \neq(n-1)}^{n} x_{i}^{p_{i}-1}\left(1-x_{1}-x_{2}-\cdots-x_{n}\right)^{p_{n+1}-1}}{\left(1-x_{n-1}\right)^{p_{1}+p_{2}+\cdots+p_{n-2}+p_{n}+p_{n+1}-1}} . \tag{5}
\end{align*}
$$

From the relation,

$$
\begin{align*}
f\left(x_{1}, x_{2}, \ldots, x_{n}\right) & =g_{1}\left(x_{1}, x_{2}, \ldots, x_{n-1} \mid x_{n}\right) f_{n}\left(x_{n}\right) \\
& =g_{2}\left(x_{1}, x_{2}, \ldots, x_{n-2}, x_{n} \mid x_{n-1}\right) f_{n-1}\left(x_{n-1}\right) \tag{6}
\end{align*}
$$

where $f_{n-1}\left(x_{n-1}\right)$ and $f_{n}\left(x_{n}\right)$ are the pdfs of $X_{n-1}$ and $X_{n}$ and from (4) and (5) we have

$$
\begin{aligned}
f_{n-1}\left(x_{n-1}\right)= & \frac{g_{1}\left(x_{1}, x_{2}, \ldots, x_{n-1} \mid x_{n}\right)}{g_{2}\left(x_{1}, x_{2}, \ldots, x_{n-2}, x_{n} \mid x_{n-1}\right)} f_{n}\left(x_{n}\right) \\
= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right) \Gamma\left(p_{n}\right)}{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-2}+p_{n}+p_{n+1}\right) \Gamma\left(p_{n-1}\right)} \\
& \times \frac{x_{n-1}^{\left(p_{n-1}-1\right)}\left(1-x_{n-1}\right)^{\left(p_{1}+p_{2}+\cdots+p_{n-2}+p_{n}+p_{n+1}-1\right)}}{x_{n}^{\left(p_{n}-1\right)}\left(1-x_{n}\right)^{\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}-1\right)}} f_{n}\left(x_{n}\right) .
\end{aligned}
$$

Integrating both sides with respect to $x_{n-1}$, one gets

$$
\begin{aligned}
1= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right) \Gamma\left(p_{n}\right)}{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-2}+p_{n}+p_{n+1}\right) \Gamma\left(p_{n-1}\right)} \\
& \times \frac{\Gamma\left(p_{n-1}\right) \Gamma\left(p_{1}+p_{2}+\cdots+p_{n-2}+p_{n}+p_{n+1}\right)}{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n}+p_{n+1}\right)} \\
& \times \frac{f_{n}\left(x_{n}\right)}{x_{n}^{p_{n}-1}\left(1-x_{n}\right)^{p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}-1}}
\end{aligned}
$$

In turn, one gets

$$
\begin{align*}
f_{n}\left(x_{n}\right)= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n}+p_{n+1}\right)}{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right) \Gamma\left(p_{n}\right)} \\
& \times x_{n}^{p_{n}-1}\left(1-x_{n}\right)^{p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}-1}, 0<x_{n}<1, \tag{7}
\end{align*}
$$

which is $\operatorname{Beta}\left(p_{n}, p_{1}+p_{2}+\cdots+p_{n-1}+p_{n+1}\right)$.
Recalling from (6), the relation

$$
f\left(x_{1}, x_{2}, \ldots, x_{n}\right)=g_{1}\left(x_{1}, x_{2}, \ldots, x_{n-1} \mid x_{n}\right) f_{n}\left(x_{n}\right)
$$

and substituting for $g_{1}(\cdot)$ and $f_{n}(\cdot)$ from (4) and (7), one gets

$$
\begin{aligned}
f\left(x_{1}, x_{2}, \ldots, x_{n}\right)= & \frac{\Gamma\left(p_{1}+p_{2}+\cdots+p_{n}+p_{n+1}\right)}{\Gamma\left(p_{1}\right) \Gamma\left(p_{2}\right) \ldots \Gamma\left(p_{n}\right) \Gamma\left(p_{n+1}\right)} \\
& \times \prod_{i=1}^{n} x_{i}^{p_{i}-1}\left(1-x_{1}-x_{2}-\cdots-x_{n}\right)^{p_{n+1}-1}
\end{aligned}
$$

$x_{i}>0, i=1,2, \ldots, n, \sum_{i=1}^{n} x_{i}<1$, i.e., $X$ is $\operatorname{Dirichlet}\left(p_{1}, p_{2}, \ldots, p_{n}, p_{n+1}\right)$. Hence the proof is complete.
Corollary 2.3. A random vector $\left(X_{1}, X_{2}\right)$ with continuous non-negative components and satisfying $X_{1}+$ $X_{2}<1$ is bivariate Beta with parameters $p_{1}, p_{2}$ and $p_{3}$ if and only if
(i) $\frac{X_{1}}{1-X_{2}}$ is Beta $\left(p_{1}, p_{3}\right)$ and is independent of $X_{2}$
(ii) $\frac{X_{2}}{1-X_{1}}$ is $\operatorname{Beta}\left(p_{2}, p_{3}\right)$ and is independent of $X_{1}$.

Remark 2.4. Conditions (i) and (ii) of Theorem 2.2 can be equivalently worded as
(i) $Y^{\prime}=\left(Y_{1}, Y_{2}, \ldots, Y_{n-1}\right)$ given $X_{n}$ is $\operatorname{Dirichlet}\left(p_{1}, p_{2}, \ldots, p_{n-1}, p_{n+1}\right)$ and
(ii) $Z^{\prime}=\left(Z_{1}, Z_{2}, \ldots, Z_{n-2}, Z_{n}\right)$ given $X_{n-1}$ is
$\operatorname{Dirichlet}\left(p_{1}, p_{2}, \ldots, p_{n-2}, p_{n}, p_{n+1}\right)$.
Remark 2.5. In characterizing a n-variate Dirichlet, Darroch and Ratcliff (1971) need $n$ conditions on the independence of certain functions of the random variables. Rao and Sinha (1988) impose the condition of linearity of all the $n$ regressions. Further, they need the pdf in a certain form. Our result is based on only two conditions, irrespective of $n$, which may be of interest to note. However, when $n=2$ our conditions turn out to be much stronger than Theorem 1 of Darroch and Ratcliff (1971).
